C350 Technical Datasheet

Maraging Steel

Typical Applications
- Missile casings
- Tooling
- Ordnance mounting blocks
- High performance motorsport components
- Couplings
- Jet engine and helicopter drive shafts
- Load cells
- Landing gear

Product Description
C350 - a maraging alloy steel containing 12.0% cobalt and 4.8% molybdenum. This steel is produced by vacuum arc re-melting and provides a very high strength nominally 350 ksi tensile (2415 MPa) with an above average level of toughness. The alloy retains its strength up to 450°C and good notch impact is maintained down to minus 50°C and below. This material may be nitrided. C350 is usually supplied in the annealed condition where the microstructure consists of fine martensite before final heat treatment.

Machining & Welding
Maraging steels are usually machined in the annealed condition, however, they can be machined in the maraged condition. Components can be machined close to finished dimensions as the low temperature maraging treatment results in minimal distortion. In addition, the small contraction of approximately 0.05% due to maraging results in good dimensional stability.

C350 steel has good weldability.

Availability
Bar and forgings.
